QUALITY OF RAW DATA IS IMPORTANT

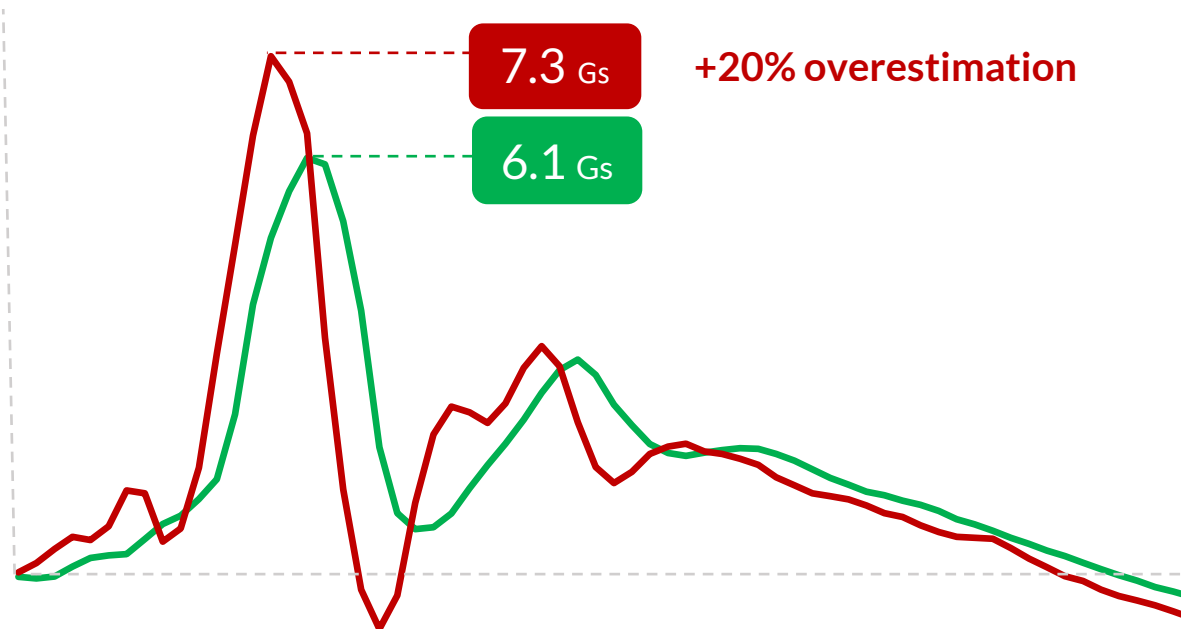

SKIN (BELT)

SHORTS

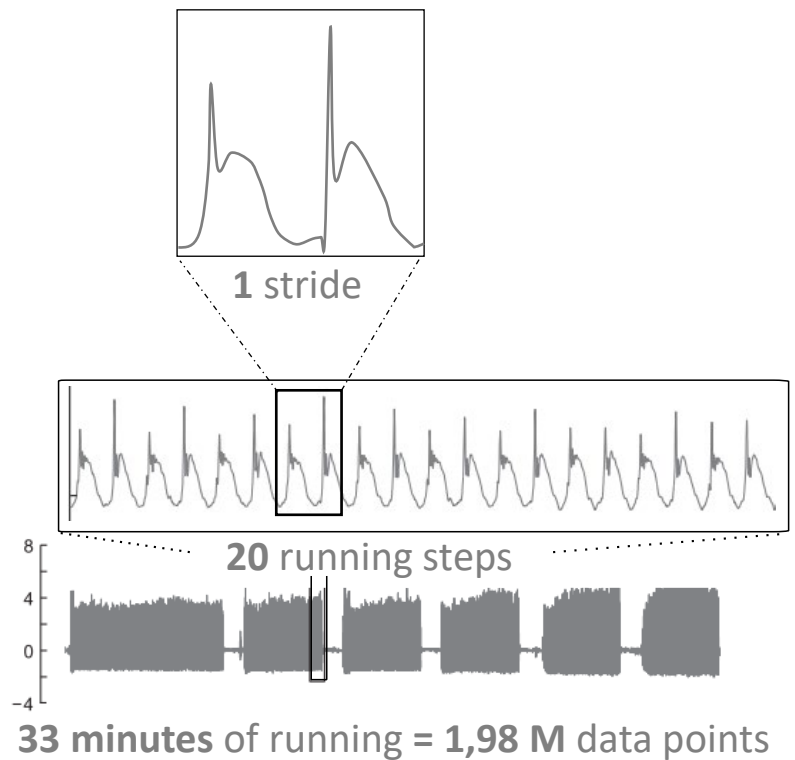

VERTICAL ACCELERATION (IMPACT)

RAW DATA

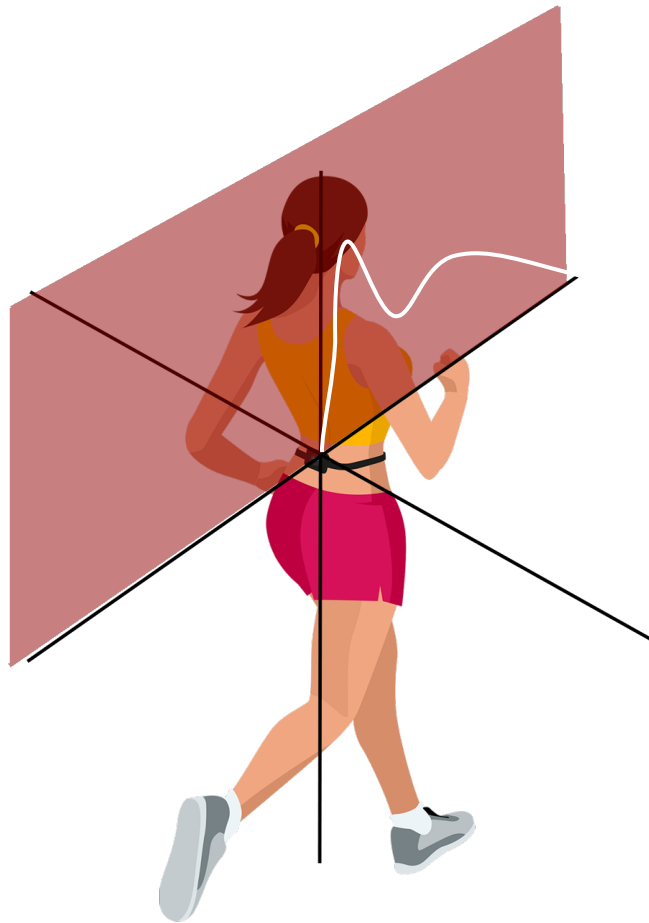

ACTIONABLE INSIGHTS

MEANINGFUL METRICS AID INTERPRETABILITY: 3 KEY METRICS

#1 KEY METRIC: IMPACT MAGNITUDE

The **peak vertical acceleration** reaching the pelvis
Expressed in Gs (gravitational acceleration)

Linked To: Strength Capacity Of The Legs to absorb impacts

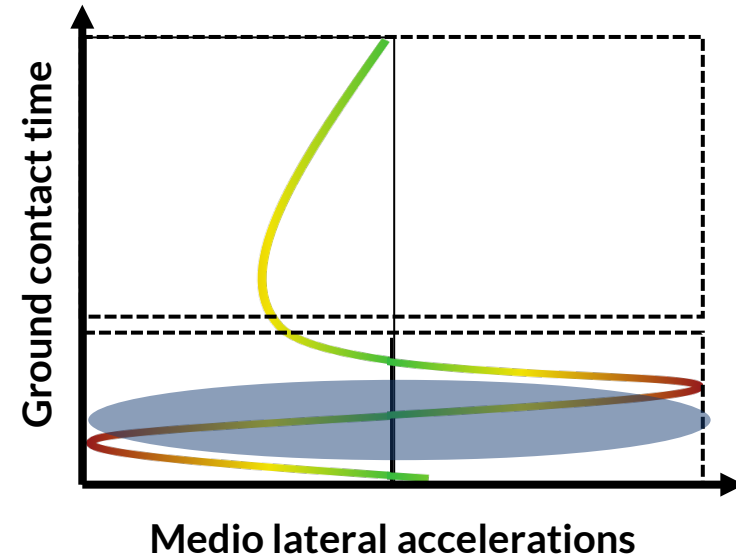

#2 KEY METRIC: IMPACT DURATION

The **timing** between foot strike & reaching the impact peak

Linked To: Efficiency of kinetic chain of the legs to slow down impacts travelling through the legs

#3 KEY METRIC: DYNAMIC INSTABILITY

The proportion of medio-lateral movement during stance phase

Linked To: Ability of legs to stabilize hips while landing correlated with fatigue and running efficiency

SOLID METRICS CAN PROVIDE INSIGHTS

A photograph of two men running on treadmills in a gym. The man on the left is wearing a black shirt and dark pants, looking at the treadmill's display. The man on the right is wearing a white t-shirt, black shorts, and a cap, running with his hands on his hips. The gym has large windows in the background showing trees and buildings. The text 'PROBLEM SOLVED?' is overlaid in white on the left side. There are four horizontal bars on the right side: a red one at the top, a red one below it, a light blue one below that, and a dark blue one at the bottom.

PROBLEM SOLVED?

INDIVIDUAL RESPONSES OF CLIENTS MAKE INTERPRETATION OFTEN NON-TRIVIAL

- Real-time feedback to experiment with different cues
- Test and re-test efficiently
- Colored benchmarks for absolute and relative values to speed up interpretation of the metrics

HOW TO INTERPRET MULTIPLE METRICS TOGETHER?

RUNNING QUALITY VISUALIZATION: THE SCORE RUNNERS LOVE TO IMPROVE

WEAKEST LINK DETECTION

To know what to work on first
with your runner

INDIVIDUALIZED TRAINING RECOMMENDATIONS

To know how to utilize the
data in re/prehab

ONE GLOBAL SCORE

To help your runner's reach their
fullest potential. Based on 3 main
sub-components

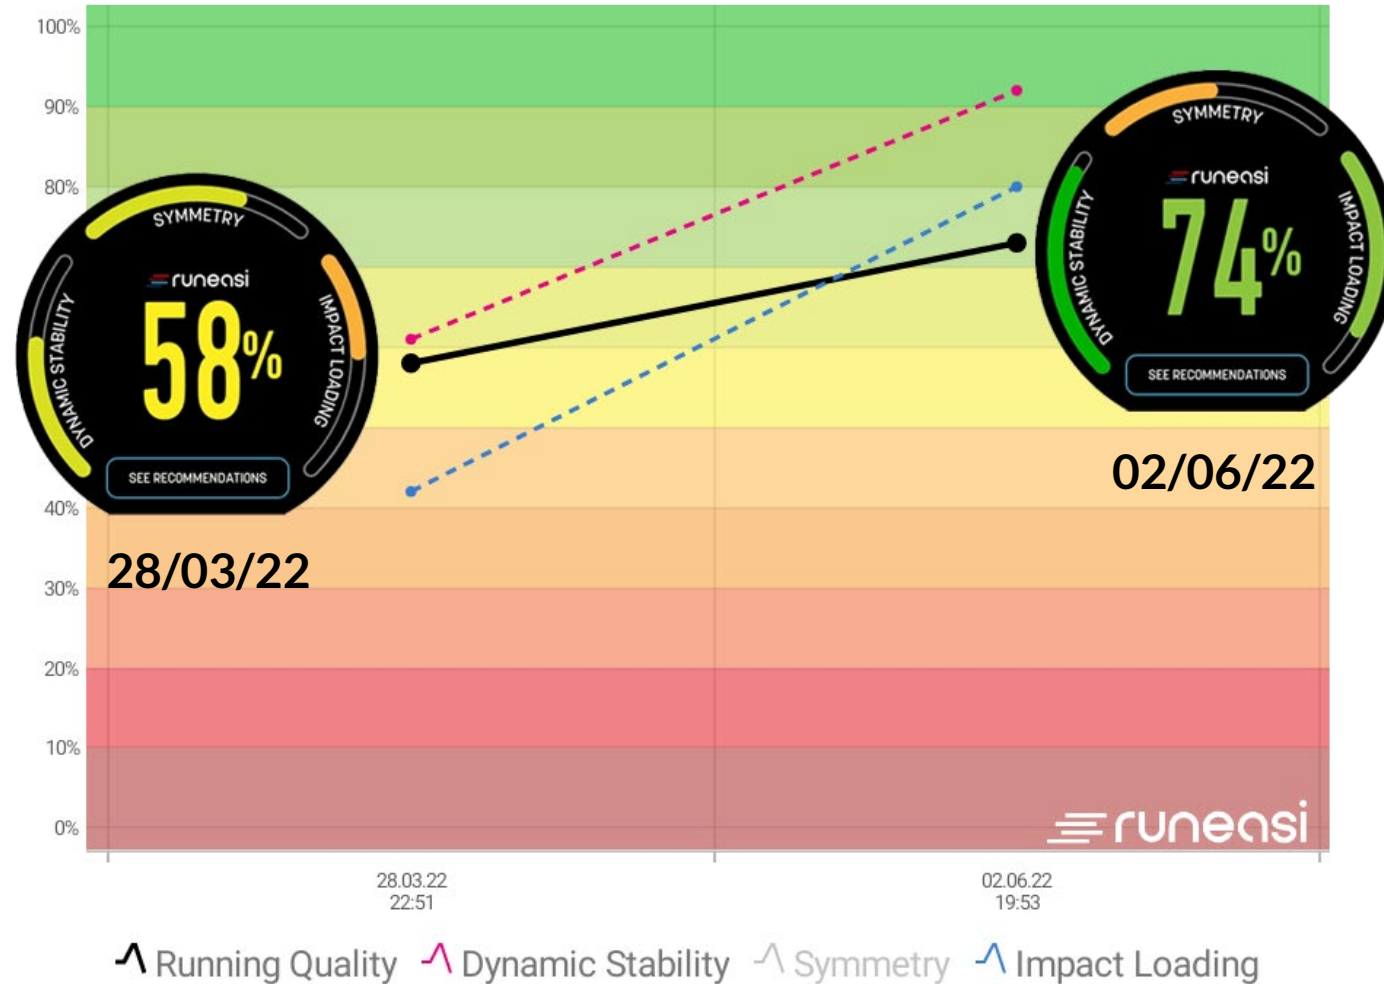

BENCHMARK DATA

To be data-informed based on
healthy norms

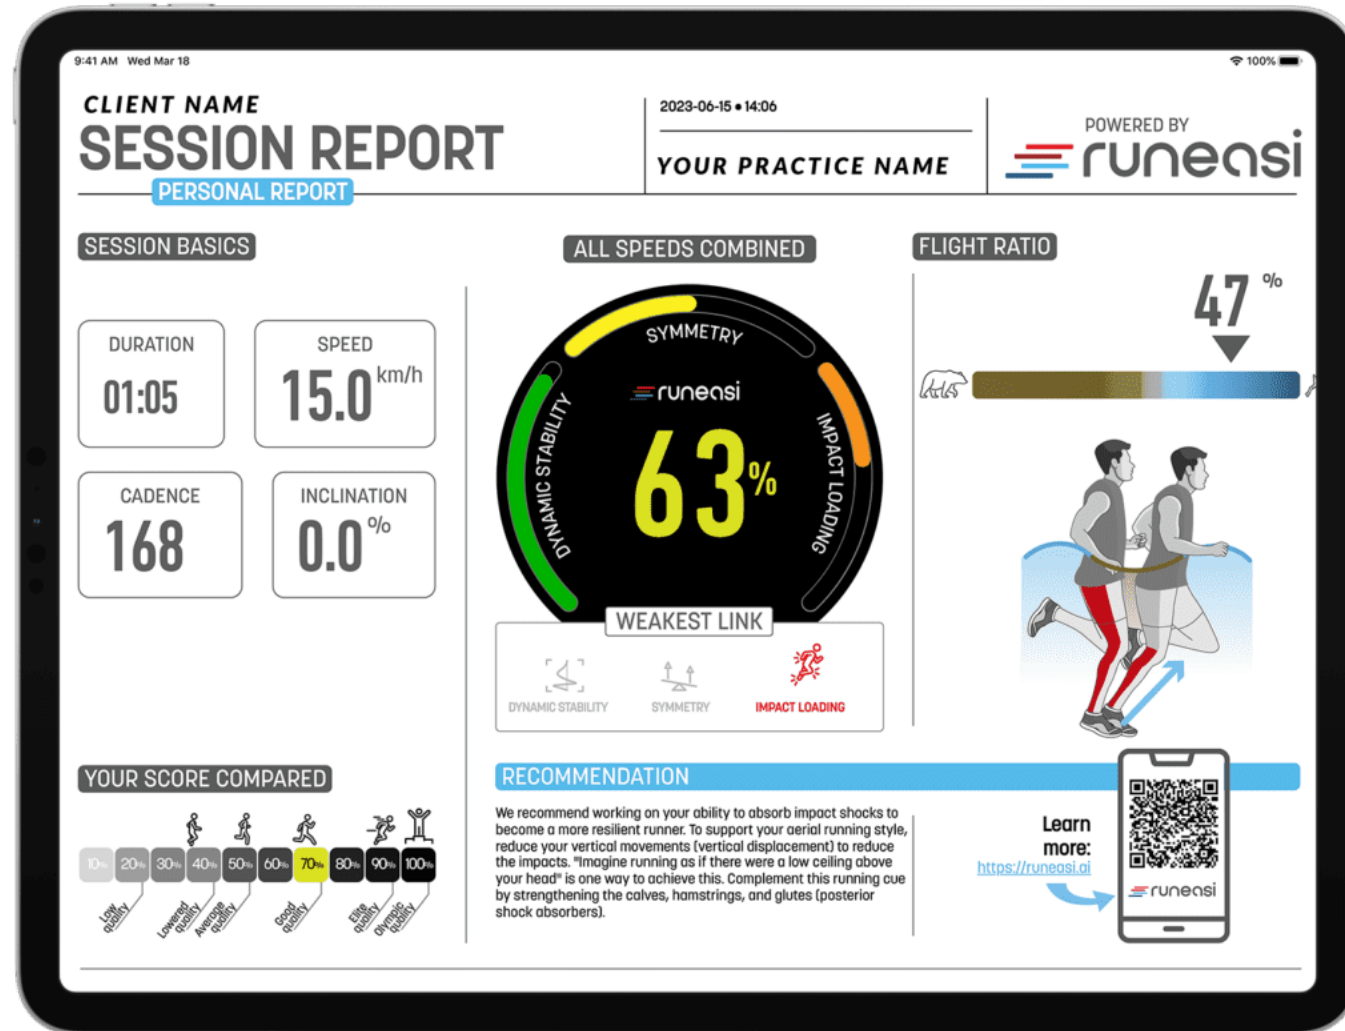

PERSONALIZED EXERCISES CAN IMPROVE RUNNING QUALITY

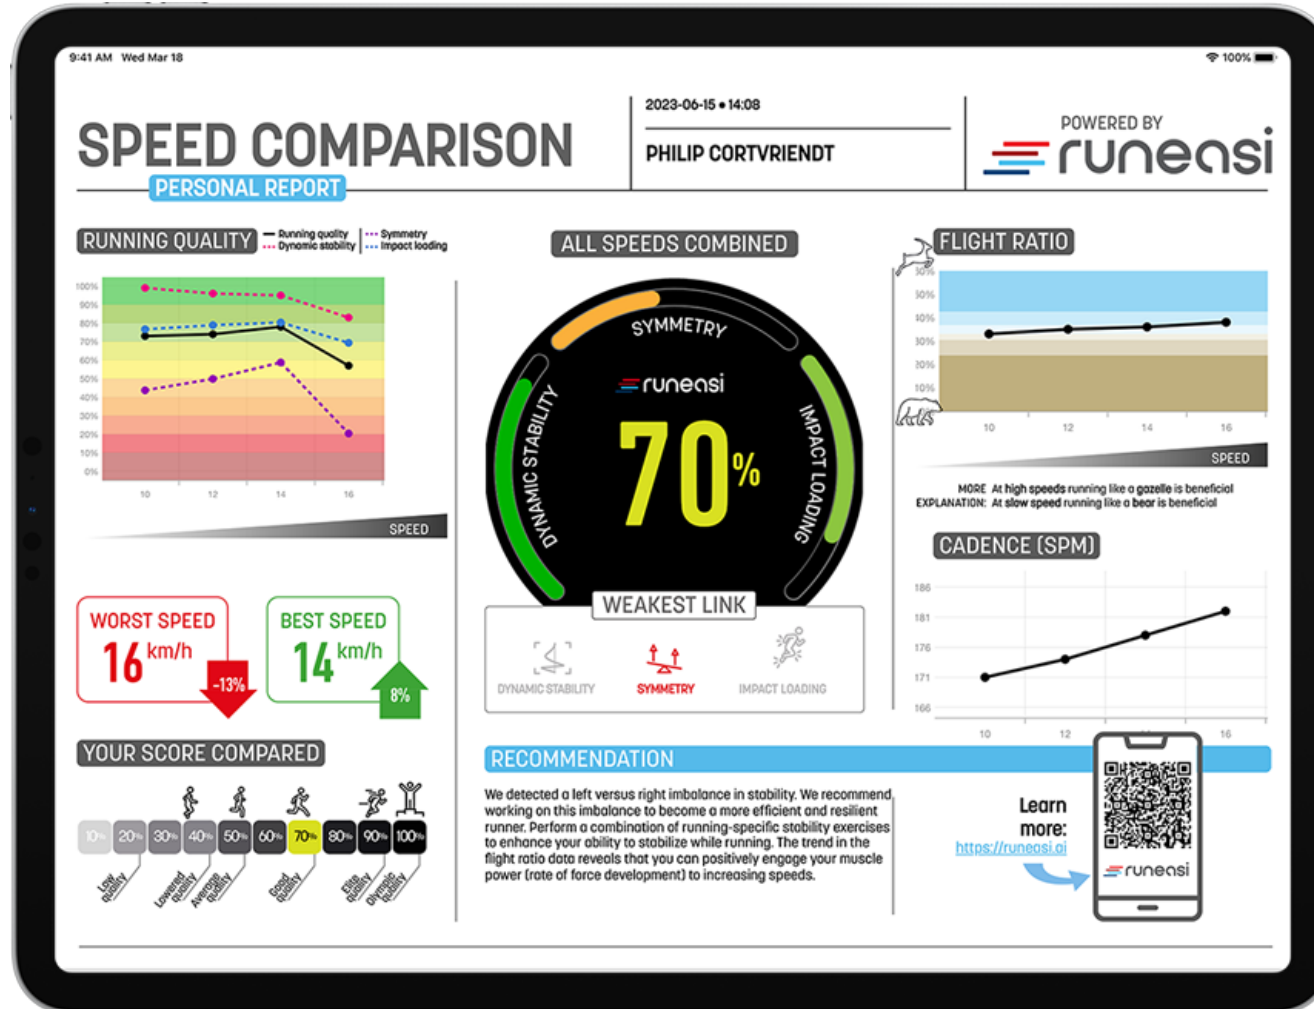

Case of 2 months plyometrics & COD training

INDIVIDUALIZED TRAINING RECOMMENDATIONS

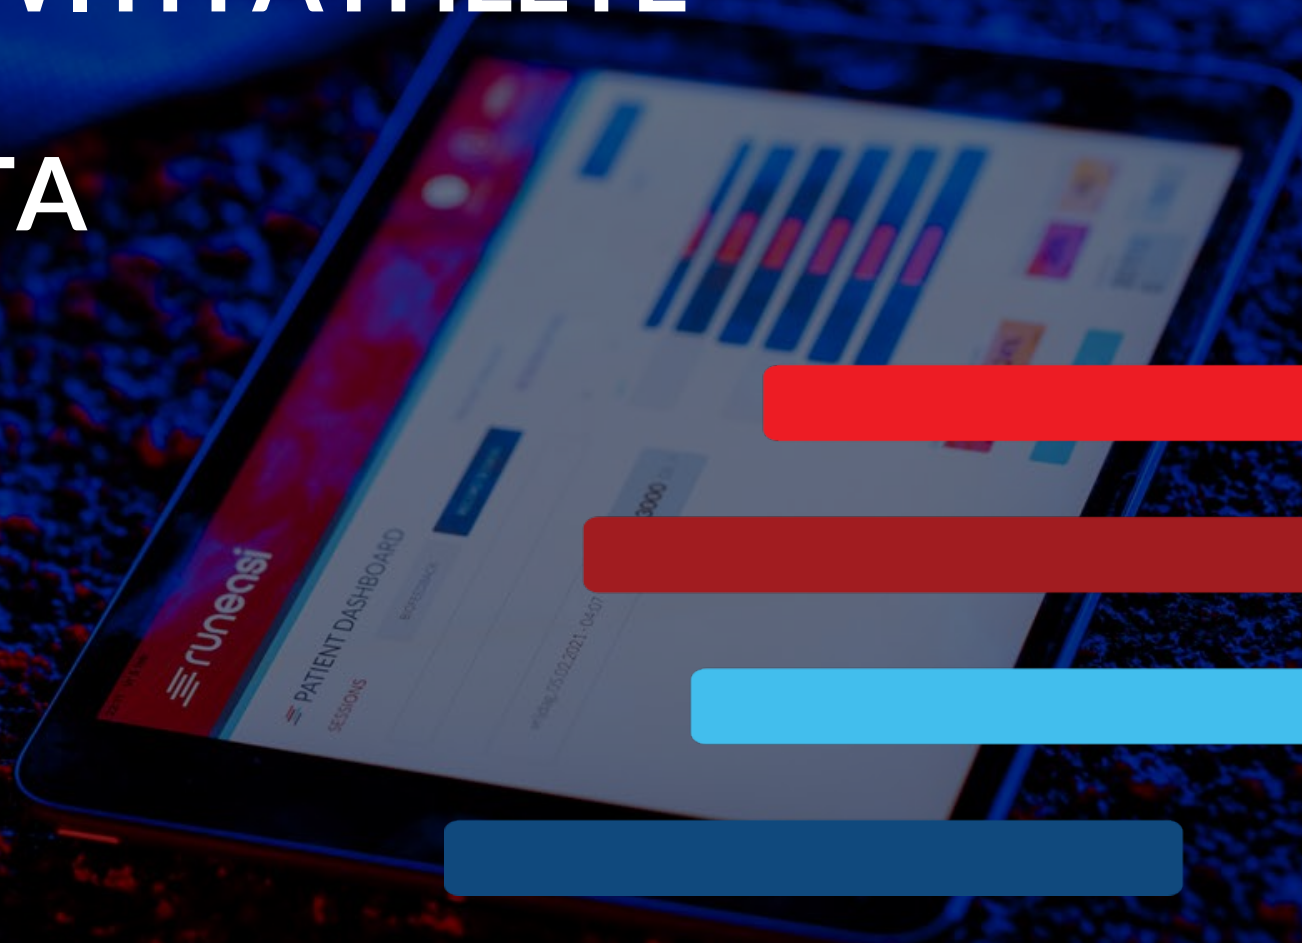

INDIVIDUALIZED TRAINING RECOMMENDATIONS

DATA SCIENCE CHALLENGES

WHEN WORKING WITH ATHLETE

MONITORING DATA

More training?
More recovery?

Monitoring training load and load capacity is key.

Relationships Between the External and Internal Load in Professional Soccer

Jaspers A. *, Op De Beéck T. *, Brink M., Frencken W., Staes F., Davis J.**, Helsen W.** (2018).

Relationships between the external and internal training load in professional soccer: what can we learn from machine learning?

International journal of sports physiology and performance, 13(5), 625-630.

* Shared First Author

** Shared Last Author

Typical Challenges

- Sport science challenges
 - Many External Load Indicators (ELIs)
 - Multi-collinearity and Non-linear relationships
 - No Normative data
- Data science challenges
 - Limited individual data
 - Noisy data
 - Individual characteristics

Approach: Machine Learning

1. Define features
2. Collect data
3. Learn model
4. Make predictions

Features: Describe problem

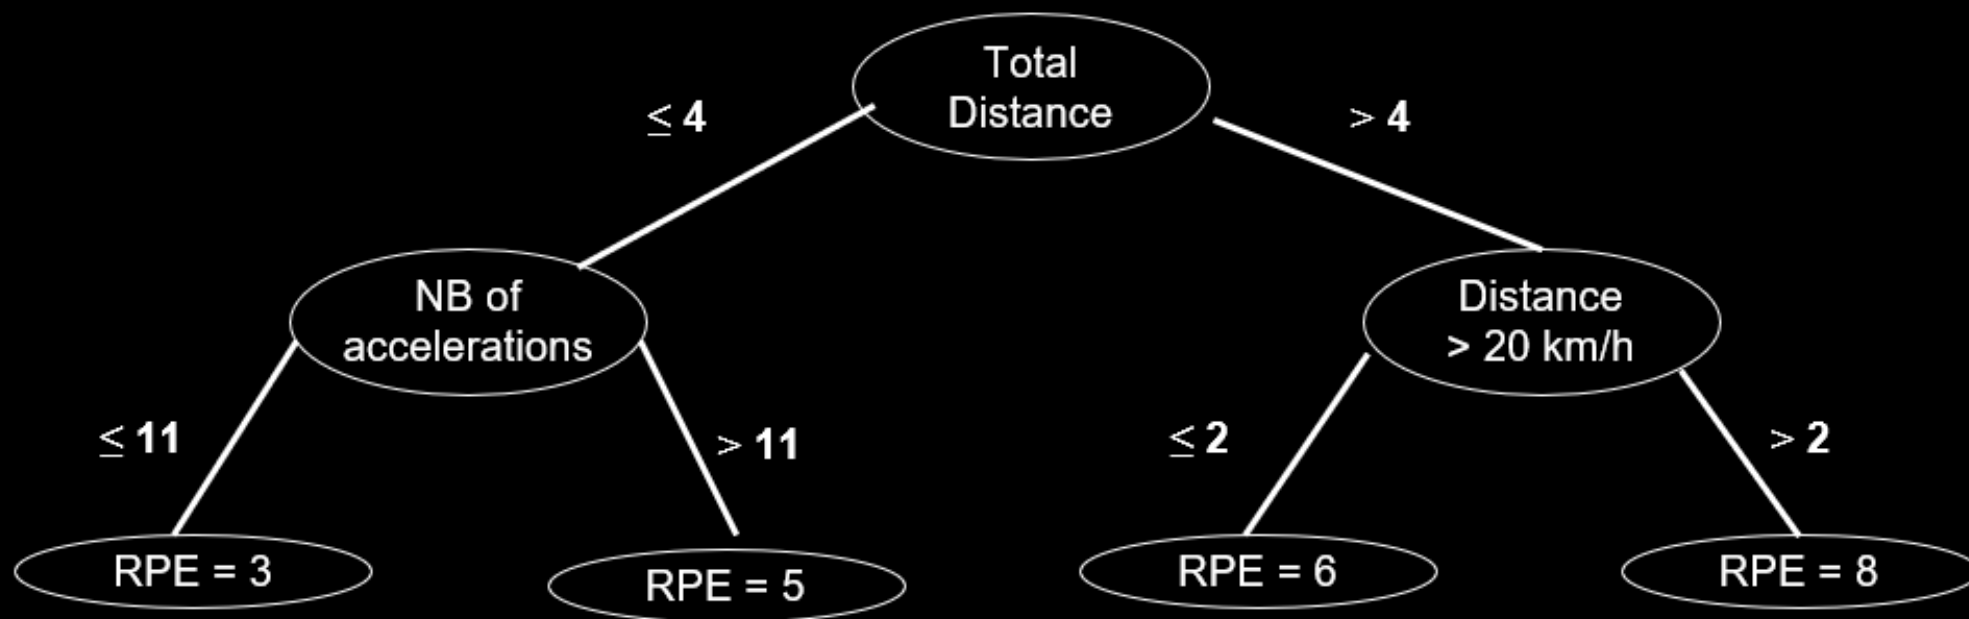

Player	Date	Distance > 20 km/h	...	Total Distance	NB of accelerations	RPE
?	?	?	...	?	?	?
?	?	?	...	?	?	?
?	?	?	...	?	?	?
?	?	?	...	?	?	?

Collect data

Player	Date	Distance > 20 km/h	...	Total Distance	NB of accelerations	RPE
1	02/01	0.5	...	3.23	10	4
1	03/01	1.2	...	7.50	54	7
⋮	⋮	⋮	...	⋮	⋮	⋮
21	04/03	1.3	...	6.78	23	5

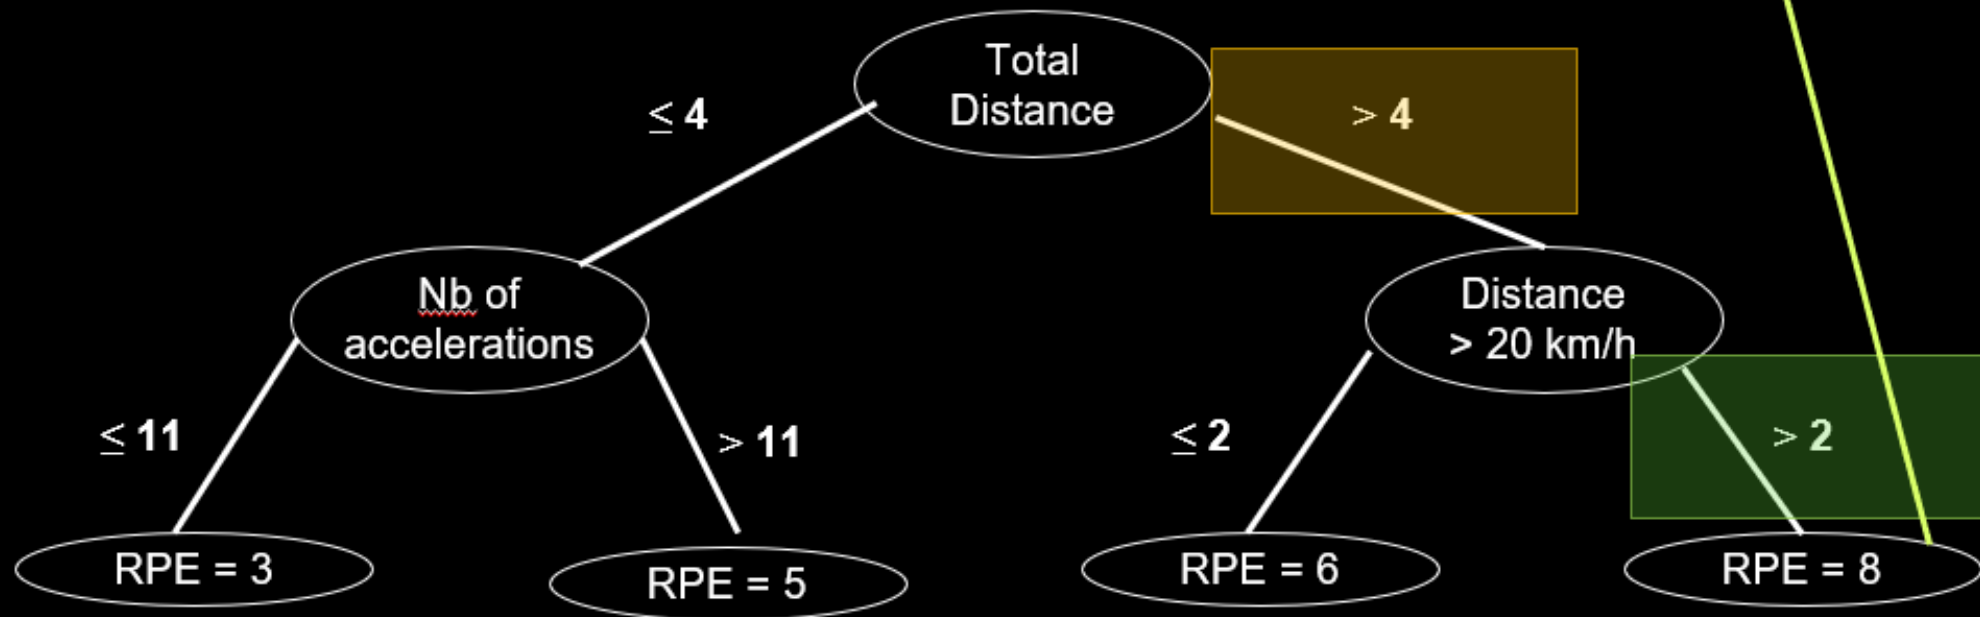

Learn model

Player	Date	Distance > 20 km/h	...	Total Distance	NB of accelerations	RPE
1	02/01	0.5	...	3.23	10	4

Make predictions

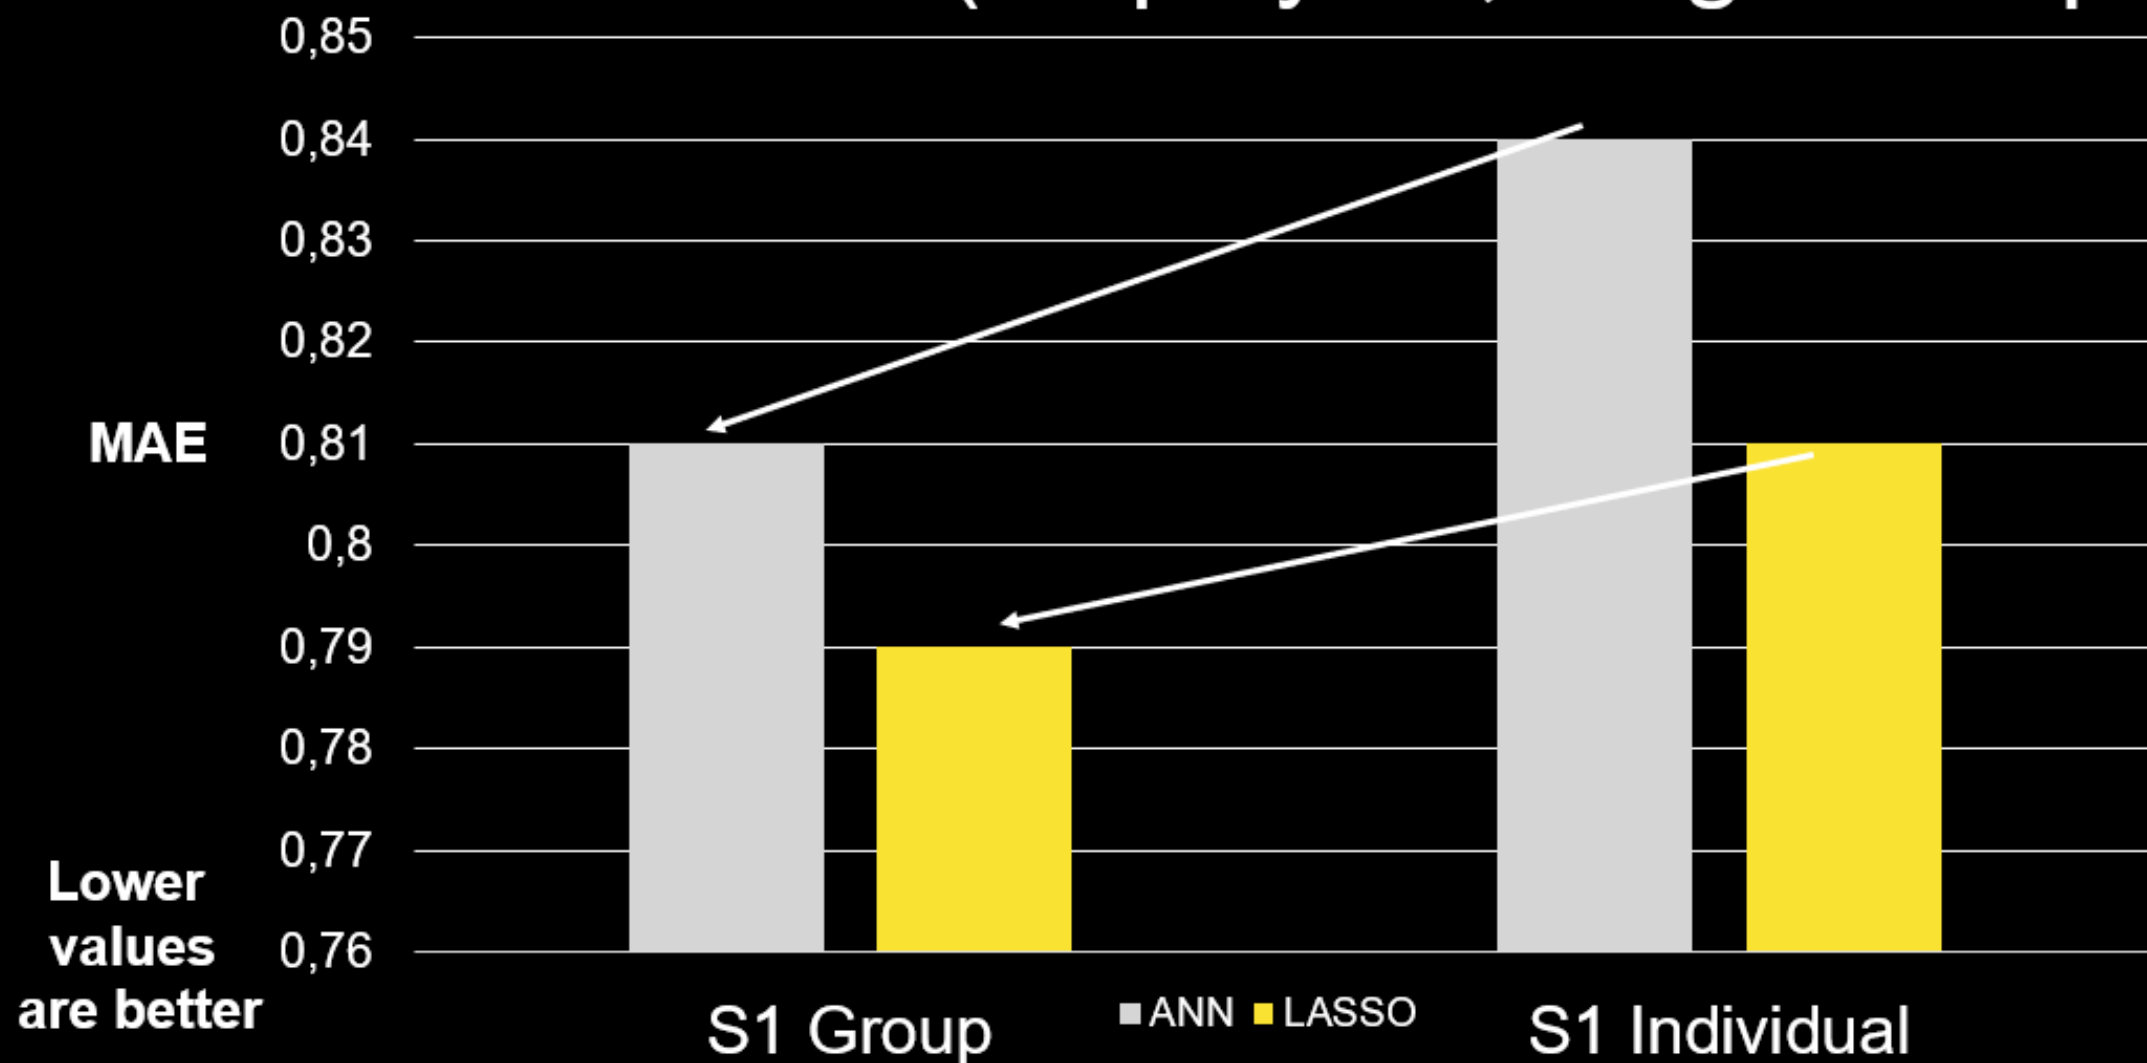

Player	Date	Distance > 20 km/h	...	Total Distance	NB of accelerations	RPE
10	05/05	4	...	5	2	??

Group models or Individual models?

Results Season 1 (23 players, no goalkeepers)

Key Insights

- Group models can be used for individual monitoring of players
- Decelerations are perceived as exerting by players

Fatigue Prediction in Outdoor Runners

Op De Beéck T., Meert W., Schütte K., Vanwanseele B., Davis J. (2018).

Fatigue Prediction in Outdoor Runners Via Machine Learning and Sensor Fusion.

In Proceedings of the 24th ACM SIGKDD International Conference on Knowledge Discovery & Data Mining (pp. 606-615). ACM.

Task

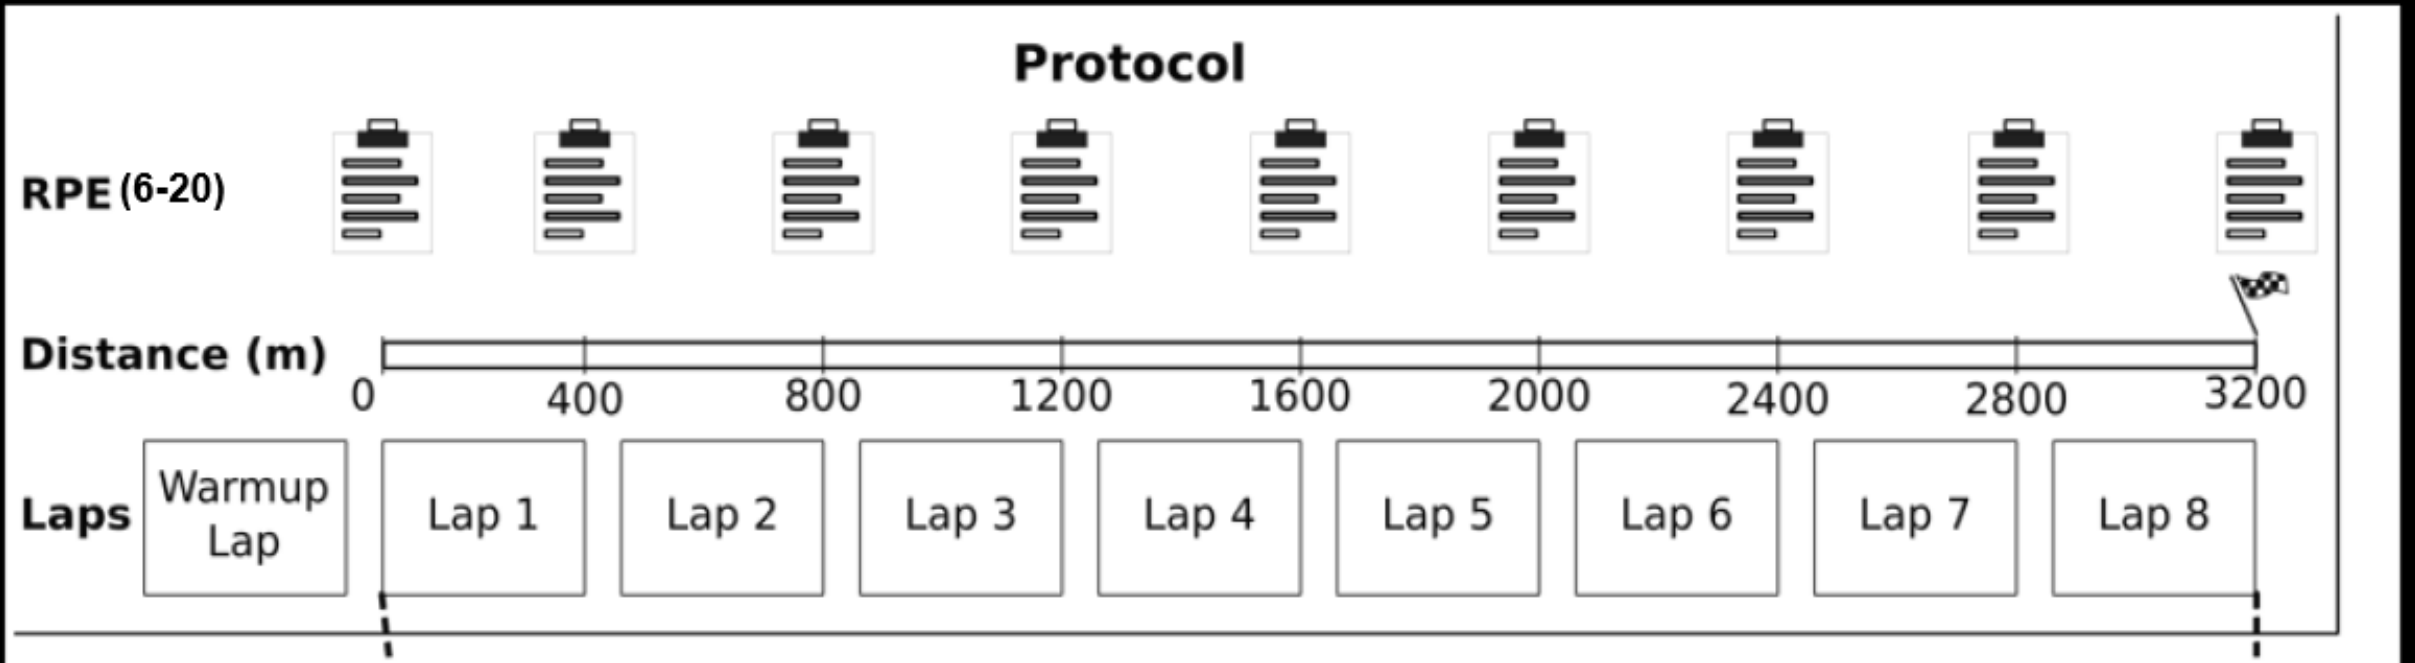

Given: GPS and accelerometer data from a player's training session

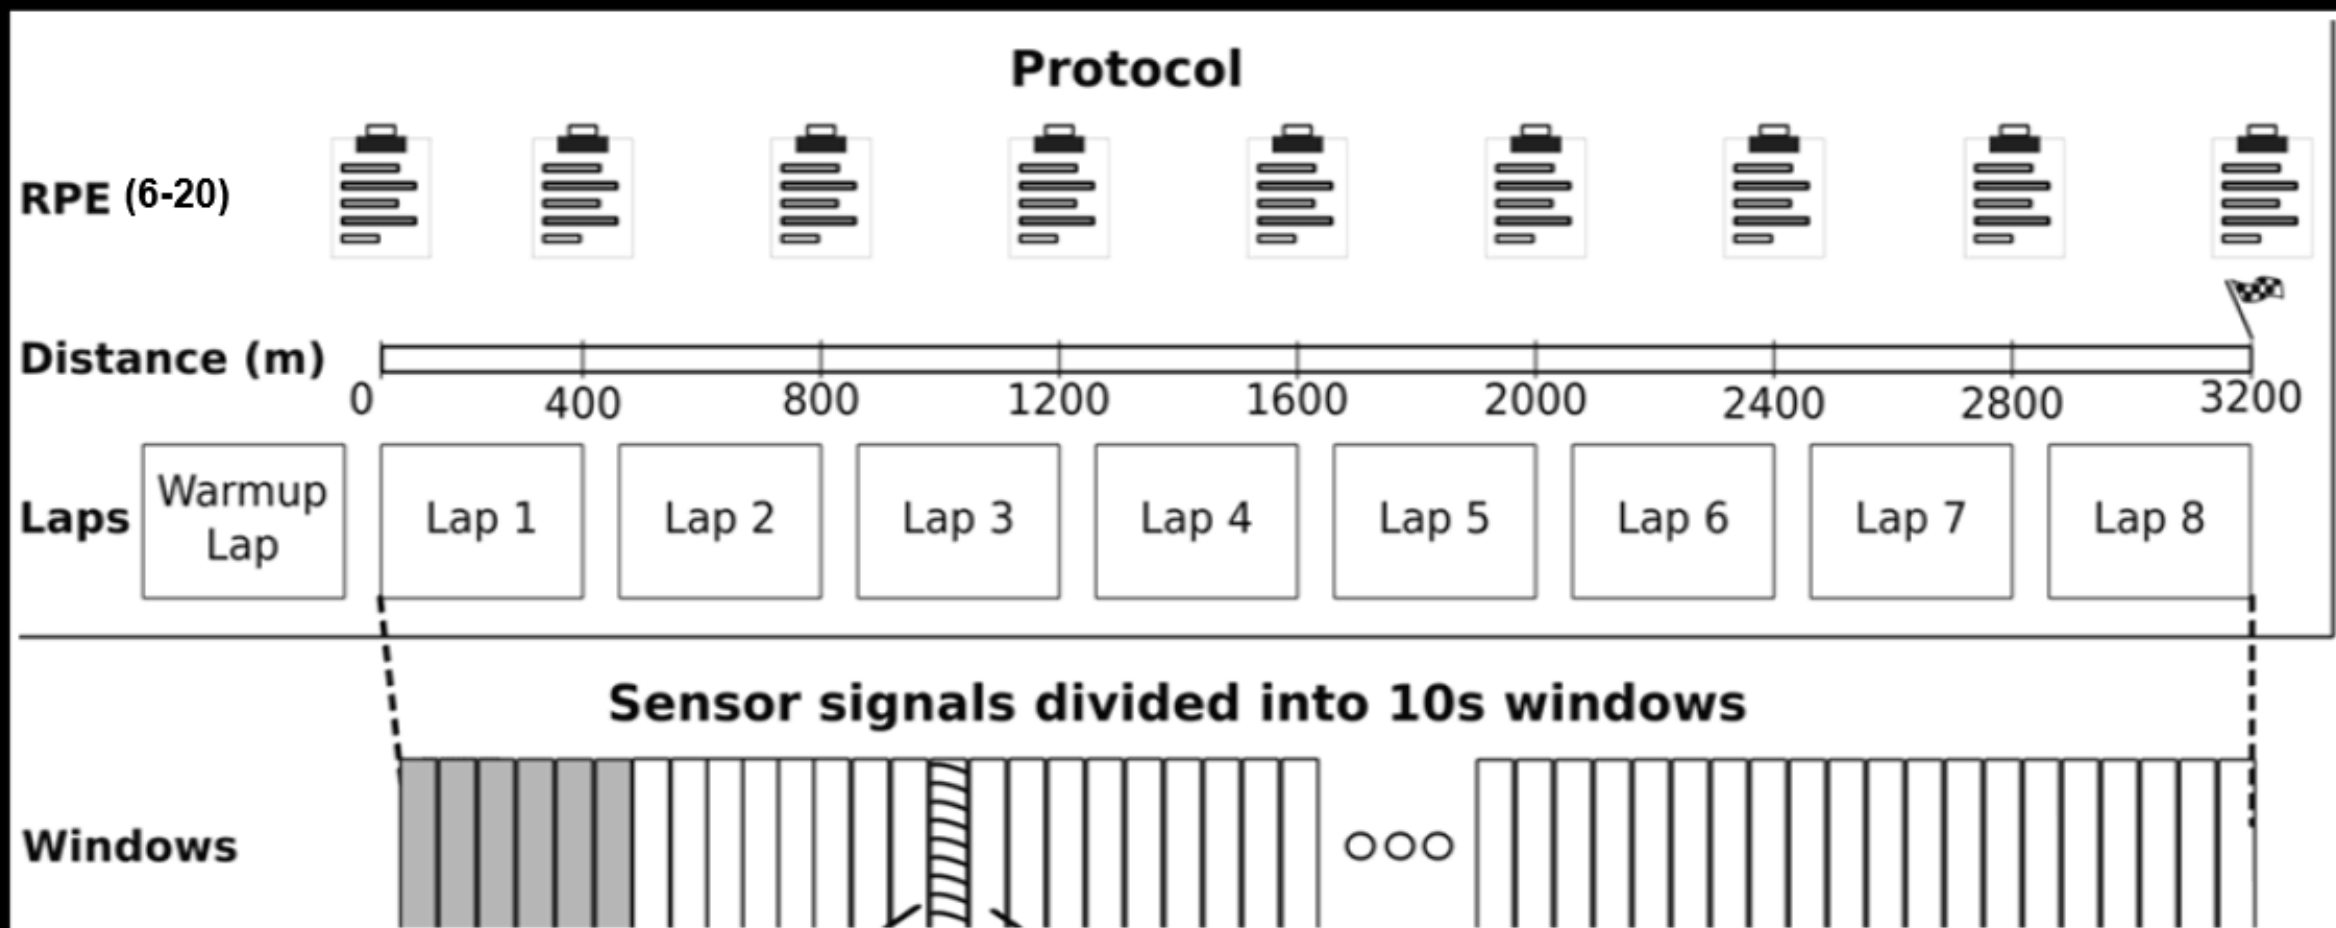

Predict: Player's Rate of Perceived Exertion (RPE)

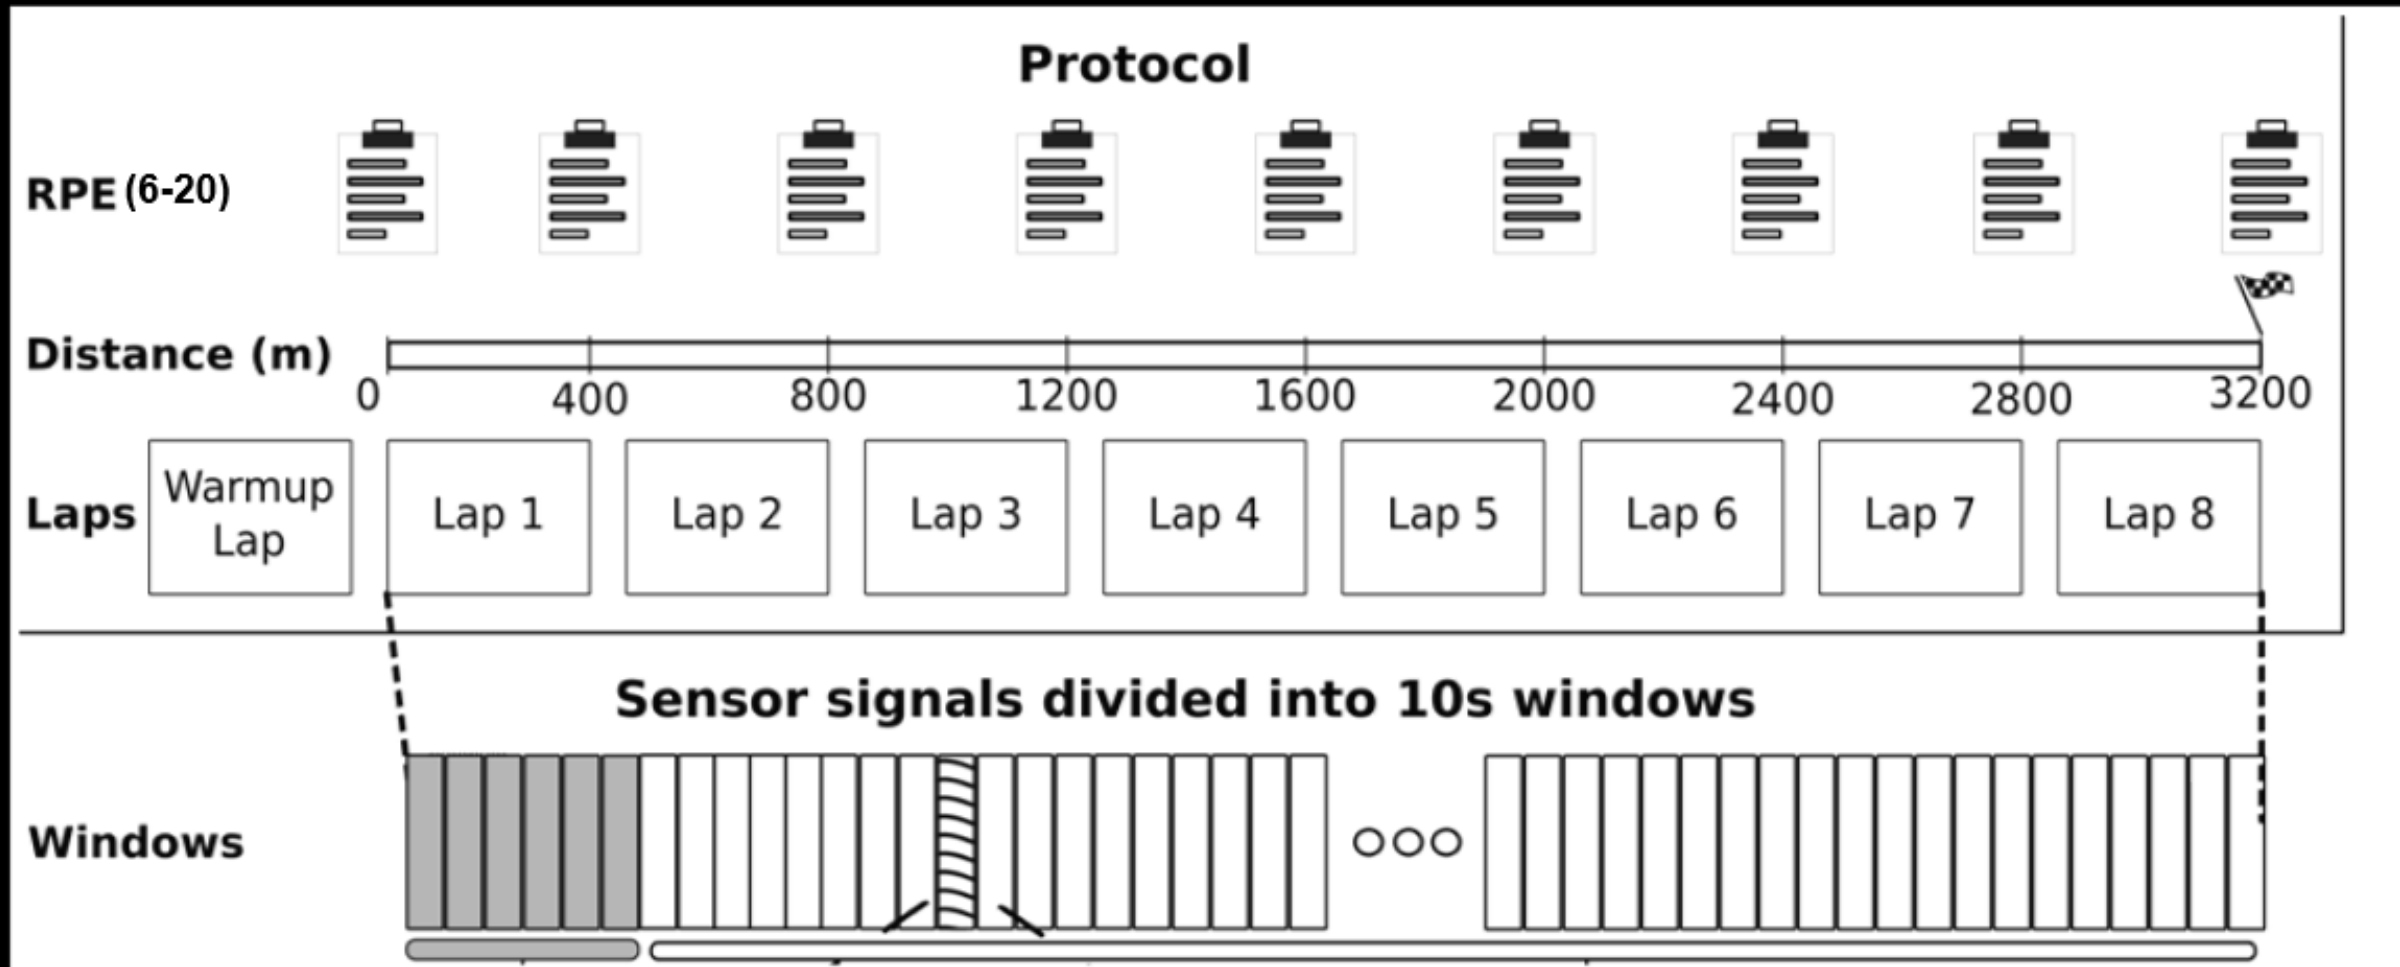

Data

Preprocessing

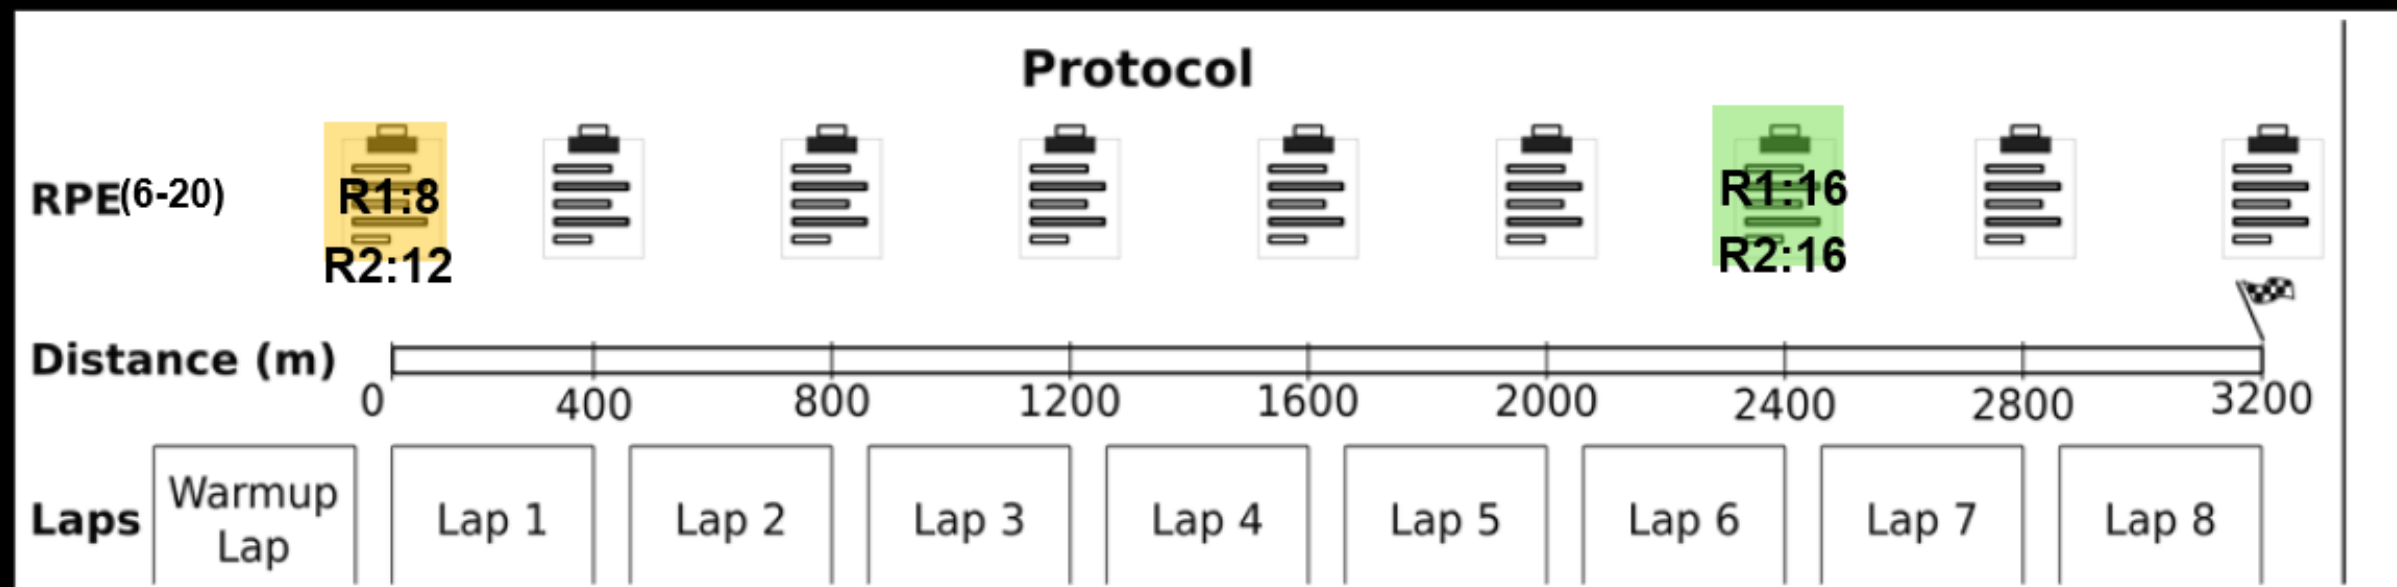

Personalized baseline

**Baseline
windows**

Normalize RPE of runner 2

$$nRPE_{r1} = \frac{(16 - 8)}{(20 - 8)} = 0.66$$

$$nRPE_{r2} = \frac{(16 - 12)}{(20 - 12)} = 0.5$$

Database

r1

r2

Regression (GBRT + simple statistical features)

	All runners model	Other runners only model	Individual model
SENSORS	MAE	MAE	MAE
Arm (A)	1.99	2.03	1.98
Wrist (W)	1.89	2.04	2.15
Tibia (T)	1.98	2.08	2.02
T-T-W-A	1.83	1.9	1.99

Lower values are better

Impact of personalized baseline

Impact of normalizing RPE values

KEY INSIGHTS

- Simple features of 1 IMU Sensor (attached to the wrist) are sufficient (
- No prior labeled data of the runner is needed
- Our methodology could account for variable running speeds, intra and inter individual differences, and subjectivity of target label

DATA CHALLENGES

AT

RUNEASI

DATA AGGREGATION IS EASY

- =AVERAGE()
- `pandas.groupby(by='x').mean()`

SOME CONSTRAINTS WHEN AGGREGATING DATA

- Consistency
- Sensitivity
- Interpretability
- Transparency

THE DEVIL IS IN THE DETAILS

- Session averages: step based vs window based
- Quality score calculations

segment NB	quality	DS	IL	SYM
1	85	89	94	73
2	87	90	96	75
3	87	89	96	76
4	79	88	94	56
5	81	89	95	59
6	85	88	95	70
7	92	92	94	89
8	83	89	94	66
9	72	84	94	38
AVERAGE OF SEGMENTS	83,44444	88,66667	94,66667	66,88889

Based on average metrics **90** **89** **95** **87**

How you aggregate can affect outcome

Left vs Right differences

SEGMENT	DS LEFT	DS RIGHT	LEG	L-R-%
1	19,7	18,6	L	2,9
2	18,8	19	R	0,5
3	19,8	18,5	L	3,4
4	20,3	18,7	L	4,1
5	20	18,4	L	4,2
6	19,7	18,9	L	2,1
7	18,4	18,7	R	0,8
8	19,7	18,7	R	2,6
9	19	21,2		5,5

COMPUTING BENCHMARKS

- Health e-run study
 - Participants did not have injuries
 - **Variety** in runners (start to run → experienced)
 - **Outdoor data collection** (at least 3 training sessions)

Benchmarks V1

Typical	Mean + 1 standard deviation
Elevated	Mean + 2 standard deviation
High	Mean + 3 standard deviation
Very high	Mean + 3 standard deviation

Assumption:
Injured people are expected here

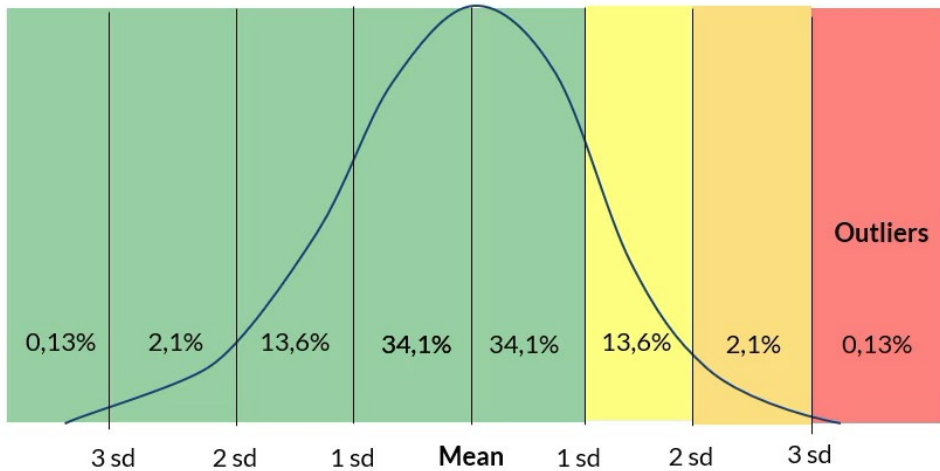

Problem 1

Not always a normal distribution in real-world data

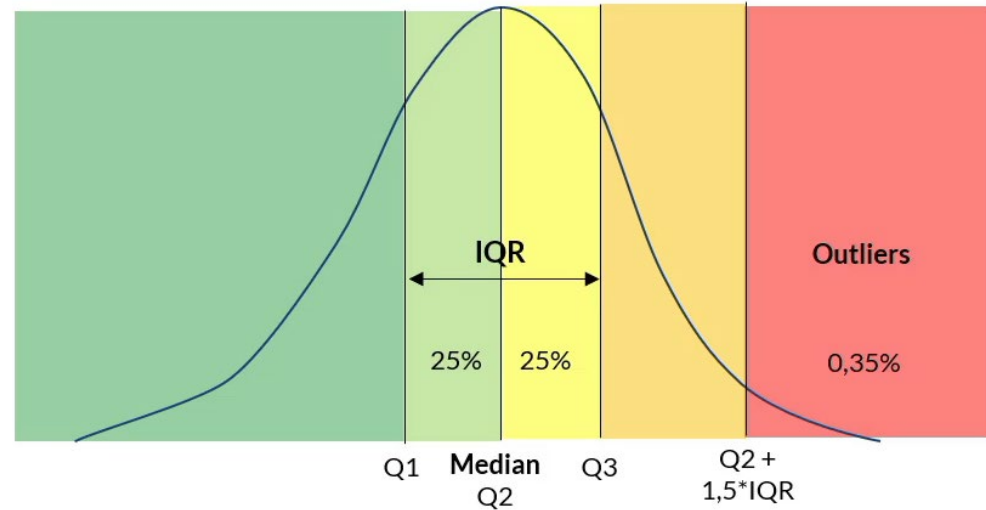

Benchmarks V2

Old way

New way

Benchmarks V2 – problem 2

Make sure every runner in the data set contributes equally to the benchmarks

$$12 \text{ (minutes)} * 96 \text{ (runners)} = \mathbf{1152 \text{ min of data}}$$

Benchmarks V2 – problem 2

Make sure every runner in the data set contributes equally to the benchmarks

$$12 \text{ (minutes)} * 96 \text{ (runners)} = \mathbf{1152 \text{ min of data}}$$

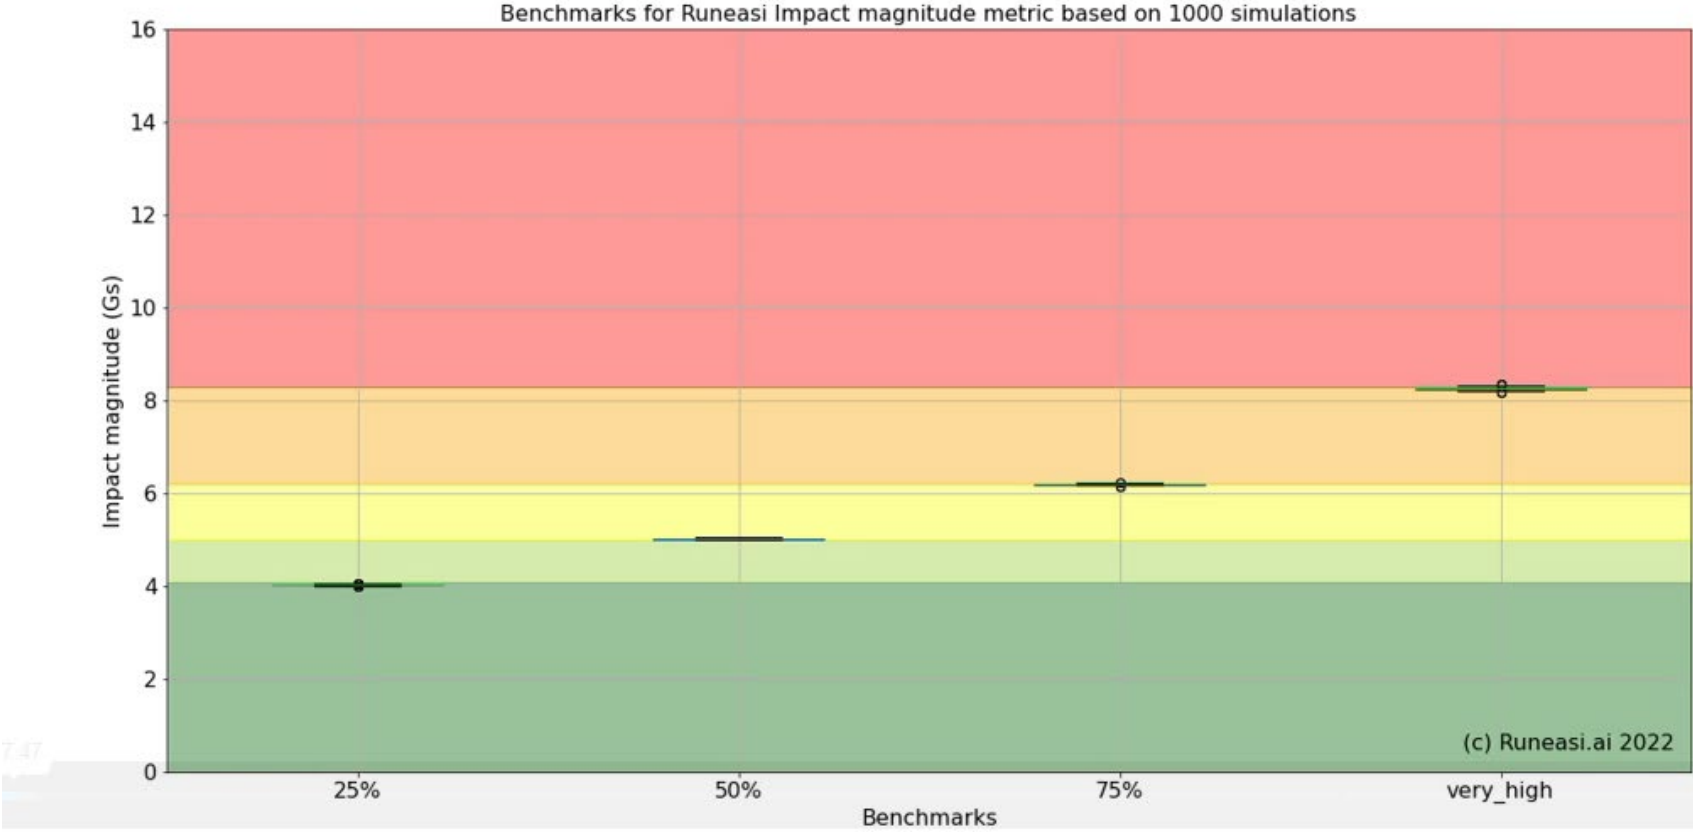

Same values when we repeat it with a different set of 12 minutes?

Normal distribution after 1000 different outcomes

Benchmarks V2 - simulating 1000 outcomes

Conclusion

Data science techniques allow us to **leverage the data of other athletes**:

1. The pipeline should **start from high quality data**
2. **Proper data contextualization** is necessary to make data actionable
3. **Correct methodology** is key to ensure generalizability to the real-world

Any questions?
